

# Wifihacker-geek: Pro Tips to Secure Your Wi-Fi

When it comes to hacking people, get nervous, and that is pretty obvious. And internet itself gives them so easy ways to hack Wi-Fi that every person may become a pro hacker. You may also have performed hacking in your life in coffee shops or in offices, but when it's your own Wi-Fi, and then you need to be very protective. So here are the tips you must follow to secure your Wi-Fi.

## **Use a strong password:**

It is important to use a strong password of your Wi-Fi. It is advisable to use more characters. The more characters you will use a password the better secure it will remain. It is advisable to use at least 20 characters as your password. And try to use the mix of letters, symbols, and numbers together.

## **Change the default settings:**

Whenever you buy a new Wi-Fi or router, it comes with some built-in settings. Even your network provider sets username and password. But they don't bother to secure your Wi-Fi. So it is advisable to change the default setting as soon as possible. This will secure your network from hacking.

## **Position your router in the best way:**

Your home Wi-Fi router should be positioned in that manner so that you can use it in the best way. But you must also look after that the router signal must not get available from the outside your house. If your router sends a low signal and lower speed then the hacker will not choose to hack that.

## **Change the name:**

All the new routers are named in their company. And this is easy for the hackers to hack Wi-Fi when they know the name of the router. It is called the service set identifier. You must name the Wi-Fi in something threatening or unique with numbers and symbols. So that hackers will not even rectify that it's your Wi-Fi.

## **Don't keep it on:**

Another thing you should follow is to keep your Wi-Fi connection turn off when you are not using this. The more you will make it available the easier it will be for the hackers to hack it with services like [wifihacker-geek.com](http://wifihacker-geek.com). So it is advisable to on your Wi-Fi only when you are using this.

## **Use the best encryptions:**

The best and most important thing you should follow to secure your Wi-Fi is to choose the best encryption. Wi-Fi works through encrypted codes. According to the strength of the encryption, there are many kinds of encryption use. It is advisable to use WPA or WPA2 encryption as they are considering as the strong ones.
